

1000+ Color Names

Shades, Codes, and Visuals

A searchable reference book for learners, writers, artists, and designers

Inside this book

- 16 color families with clickable navigation
- 128 base colors from the article
- 1,024 descriptive shade variations
- 1,152 searchable previews with HEX and RGB codes
- Glossary, FAQs, and an alphabetical color index

A practical color-learning reference

Color names help us describe shades found in nature, clothing, art, interiors, products, and digital design. Basic words such as red, blue, and green identify broad families, while names such as crimson, cerulean, sage, and mauve describe narrower shades.

16

color families

128

base colors

1,024

derived shades

1,152

total entries

Important code note

The 128 base HEX and RGB values reproduce the codes used in the article. The 1,024 descriptive variants are systematically derived reference values created for this book. Creative shade names are not universal standards, so brands and design systems may use different values for the same name.

How to use the book

- 1 Use the clickable contents page to open a color family.
- 2 Read the name, family, HEX code, RGB code, and short description.
- 3 Use the visual swatch for quick comparison, not as a calibrated print proof.
- 4 Search the PDF or use the alphabetical index to locate a specific shade.

Understanding HEX and RGB Codes

Digital color systems identify shades more accurately than names alone

[BACK TO CONTENTS](#)

HEX codes

A HEX code begins with a number sign followed by six characters. The pairs represent red, green, and blue: #RRGGBB.

RR
Red channel

GG
Green channel

BB
Blue channel

RGB values

RGB stands for red, green, and blue. Each channel uses a value from 0 to 255. The combination 255, 255, 255 produces white, while 0, 0, 0 produces black.

Red #FF0000
255, 0, 0

Green #00FF00
0, 255, 0

Blue #0000FF
0, 0, 255

White #FFFFFF
255, 255, 255

Black #000000
0, 0, 0

Azure #208FF2
44, 143, 242

Other useful systems

HSL	Hue, saturation, and lightness	Useful for adjusting digital palettes
CMYK	Cyan, magenta, yellow, and black	Common in commercial printing

Main Color Families

Sixteen broad groups organize the 1,152 color entries

Useful Words for Describing Colors

Learn how hue, tint, shade, tone, saturation, and undertone differ

[BACK TO CONTENTS](#)

Hue

The basic color family
Blue

Tint

A lighter variation
Pale Blue

Shade

A darker variation
Dark Blue

Tone

A softened variation
Dusty Blue

Saturation

The strength of a color
Vivid Blue

Lightness

How light or dark it looks
Light Blue

Undertone

A subtle underlying color
Blue-Gray

Warm

Leans toward red or yellow
Warm Beige

Cool

Leans toward blue or green
Cool White

Neutral

Low-intensity or balanced
Gray

Muted

Reduced saturation
Muted Sage

Pastel

Pale and softly saturated
Pastel Lilac

Neon

Extremely bright and saturated
Neon Green

Tint, shade, and tone

A tint is lighter, a shade is darker, and a tone is softer or less saturated.

Color Spelling and Common Confusions

American and British spelling plus frequently confused shade groups

[BACK TO CONTENTS](#)

COLOR

American English

Color names, names of colors

COLOUR

British English

Colour names, names of colours

Common color-name confusions

Teal, turquoise, aqua, and cyan

All sit between green and blue, but cyan is usually the brightest and most blue-based.

Purple and violet

Purple is a broad mixed-color term; violet is also the name of a visible-spectrum hue.

Gray and grey

They name the same color. Gray is common in American English; grey is common in British English.

Maroon and burgundy

Both are dark reds, but burgundy usually has a stronger purple or wine-like undertone.

Beige, tan, and cream

Cream is usually lighter, tan is browner, and beige generally sits between them.

Red Color Names

[BACK TO CONTENTS](#)

Red shades range from bright orange-red to dark wine-red. They often communicate warmth, energy, strength, and intensity.

Gold and Metallic Color Names

Metallic colors suggest reflective metals. A flat digital value can represent the hue, but not the full shine or texture.

How to Choose the Right Color Name

Match the level of detail to the reader, product, medium, and accessibility needs

[BACK TO CONTENTS](#)

For English learning

Begin with broad families such as red, blue, and green. Then connect specific names to them: emerald is green, lavender is purple, and caramel is brown.

For product descriptions

Use a familiar family with a clear modifier, such as deep forest green, soft dusty pink, warm caramel brown, or pale sky blue.

For digital design

Write the name together with its HEX or RGB code. Codes prevent confusion when several people work on the same design system.

For print projects

Screens use RGB light, while commercial printing commonly uses CMYK inks. Request a printed proof when color matching matters.

For accessible design

Use readable contrast and do not rely on color alone. Add labels, icons, patterns, or underlines where meaning must remain clear.

Quick accessibility checklist

- | | |
|--|---|
| ☐ Maintain readable text contrast | ☐ Add labels or icons |
| ☐ Avoid red-green-only signals | ☐ Check important pages in grayscale |
| ☐ Test on more than one screen | |

Frequently Asked Questions

Direct answers to common questions about color names and codes

[BACK TO CONTENTS](#)

1

How many color names are there?

There is no fixed total because millions of digital combinations exist, while brands, artists, and cultures use different naming systems.

2

What are the main color names in English?

Common basic colors include red, orange, yellow, green, blue, purple, pink, brown, gray, black, and white.

3

Are color and colour the same?

Yes. Color is the American spelling, while colour is the British spelling. Both words have the same meaning.

4

Can one color name have different codes?

Yes. Creative names are not always standardized, so designers and companies may assign different codes to the same shade name.

5

What is the difference between HEX and RGB?

HEX and RGB can identify the same digital shade. They simply express red, green, and blue values in different formats.

6

What is the difference between a tint and a shade?

A tint is a lighter variation of a color, while a shade is a darker variation of the same hue.

7

How can learners remember color names?

Group each new name by family and connect it with a familiar object, such as lemon yellow, chocolate brown, or emerald green.

8

Which color system is used for printing?

Commercial printing usually uses CMYK, while screens use RGB. The final result may vary with the printer, ink, paper, and color profile.

1,152 Color Entries

16 families - 128 base colors - 1,024 descriptive shades

Use names for communication and codes for precision

Color names make descriptions easier to understand, while HEX and RGB values make digital reproduction more precise. Search this PDF, use the bookmarks, or return to the contents page whenever you need a shade quickly.
